Fixed'n'Sticky

Module for Joomla!

Version 1.2.1

Preface

The module being placed into one of existing module positions creates a new position for module(s) (called target modules in this document) within a DIV block container that will move with the user scrolling (using **position:fixed** as much as possible) using javascript.

Compared with straight `position:fixed` usage, this module will confine the container to the boundaries of module position, such as **left** or **sidebar-a** in some templates.

The way module integrates into Joomla templating system can be represented in the following way:

Several copies of the module can be used to provide several module locations within respective fixed DIV boxes.

Joomla versions supported:

Joomla! 1.5 (tested on 1.5.22);
Joomla! 1.6 (tested on 1.6.0);
Joomla! 1.7 (tested on 1.7.2);
Joomla! 2.5 (tested on 2.5.6);
Joomla! 3.0 (tested on 3.0.0).

There is a special support for module chrome handling for:

- Artisteer templates;
- Joomlashine (joomlashine.com) templates;
- Support for WARP-based templates (e.g. YOOtheme); read separate chapter in this documentation; Tested against versions 5.5.14 and 6.0.8 of the engine.

How to use it the module

To use the Fixed'n'Sticky module:

- Install the module using the extension manager (archive root directory contains module version for Joomla! 1.6 and above, j15 directory contains module version for Joomla! 1.5);
- Configure your **Fixed'n'Sticky** module (please note that it is just a container for other modules):

The screenshot shows the Joomla! configuration interface for the 'Fixed'n'Sticky' module. The title is 'Configure Fixed'n'Sticky'. The configuration fields are as follows:

- Title ***: Fixed'n'Sticky
- Show Title**: ☒ Show ☐ Hide
- Position**: position-6
- Status**: Published
- Access**: Public
- Ordering**: 1. Fixed'n'Sticky
- Start Publishing**: 0000-00-00 00:00:00
- Finish Publishing**: 0000-00-00 00:00:00
- Language**: All
- Note**:
- ID**: 90
- Site**: Fixed'n'Sticky
- Module Description**: This module allows to use a module container in a position:fixed is used, otherwise

Annotations with red arrows point to the following fields:

- Position existing in template**: points to the 'Position' field (position-6).
- Published**: points to the 'Status' field (Published).
- Ordering: should be last (or only)**: points to the 'Ordering' field (1. Fixed'n'Sticky).
- Menu assignment**: points to the 'Menu Assignment' section.

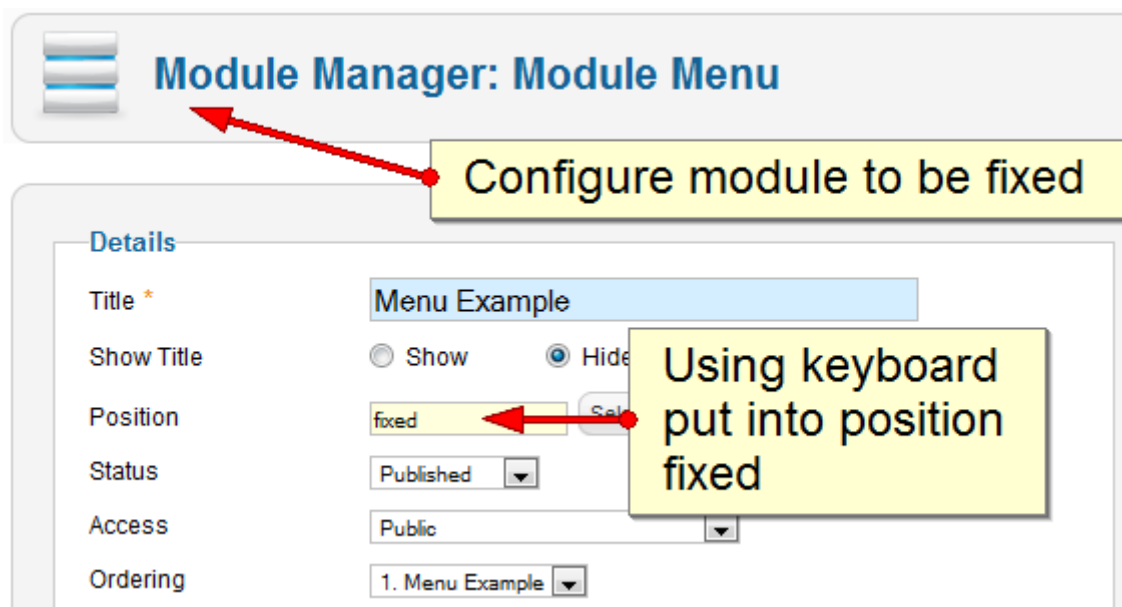

The **Menu Assignment** section includes:

- Module Assignment**: Only on the pages selected
- Menu Selection**: Select All, Clear Selection, Toggle Selection
- Menu Items**: About Joomla, Australian Parks, Fruit Shop, Main Menu, Top, User Menu
- Selected Items**: ☒ - Getting Started, ☐ ----- Related Items

- Put Fixed'n'Sticky in module position **existing in template**.
- **Enable it** (selecte Enabled – Yes on Joomla 1.5 or Published –

published on Joomla 1.6);

- **Perform menu assignment** to the menu items you wanted your target module to be shown;
- Normally you don't want to show its title (Show Title: Hide);
- In certain cases you might need to override CSS style if your menu shows incorrectly. In this case you can use '#fixeddiv_fixed' CSS selector as this will be the id of the container (unless 'Module position to provide' is changed in Fixed'n'Sticky parameters).
- Configure your **desired target (child) module** (such as main menu module) :

- Put your desired target module to be fixed to position '**fixed**' (or what 'Module position to provide' parameter in Fixed'n'Sticky parameters is changed to) - this needs to be entered manually into the position as it is not provided by template and hence isn't present in its config;

Parameters description

Default parameter values are configured to be of use in most often used configurations.

Parameter	Description
Basic parameters	
Debug	If enabled, will show a grey box with some debug information that will help solve integration problems.
Module position to provide	<p>The module will provide new position and this is the name of the position.</p> <p>It needs to be changed if several copies of the module are used to have multiple fixed boxes on screen – it must be unique.</p>
Distance from the top of the window	<p>Distance from the top or bottom of the window.</p> <p>Only one of these should be specified.</p>
Distance from the left border of the window	<p>In the same way as Y-axis distances, represent distance from the left or right border of the window.</p> <p>Only one of these should be specified.</p>
Auto-adjust column height for short pages in confined mode	On some templates HTML code produced by module might display overlapping content below when component (article) is too short.
If height auto-adjust stops floating, confinement area class	<p>In confined mode the module will try to guess the area it should stay in by navigating DOM hierarchy upwards looking for container with the size to fit the fixed box.</p> <p>In some situations (and especially if auto-adjust column height is enabled) it will be unable to find correct confinement area.</p> <p>To solve this, the confinement area HTML tag can be manually specified by indicating its id or class.</p>
or confinement area id	
Advanced parameters	
CSS style overrides (will be placed into html HEAD)	<p>Can include CSS definitions that will be placed into page header only on the pages the module is present.</p> <p>Will allow to make template CSS overrides.</p> <p>Fixed container style can be adjusted by using #fixeddiv_fixed (or rather #fixeddiv_<name of the module position>, if the position name was changed) selector.</p>
Module inclusion style (template-dependant)	Normally, Fixed'n'Sticky will use the module

	<p>inclusion style (or module chrome) from the position it is in for the target modules.</p> <p>This parameter when not empty will override that.</p> <p>Module inclusion style is a very template-dependant parameter. Most often used values are:</p> <ul style="list-style-type: none"> - xhtml - none - rounded <p>To see which styles are used to display contents by your template append ?tp=1 to your URL. This will show the page overlayed by module location names and inclusion style.</p> <p>For example, rhuk_milkyway template uses rounded module inclusion style to display rounded corners in modules such as mainmenu in left module position.</p>
<p>HTML prelude for modules</p> <p>HTML finale for modules</p>	<p>Prelude and finale to be used when rendering modules.</p> <p>It can be used for example when there should be a border around all the child modules, not around each child module separately.</p> <p>For example:</p> <p>prelude <div style="border: 1px solid red"></p> <p>finale </div></p> <p>Will paint red border around all child modules as a whole.</p>

Using Fixed'n'Sticky module with WARP-based templates (from YOOtheme)

YOOtheme templates use special templating engine (WARP) which deviates significantly from how Joomla usually renders modules.

In order to use Fixed'n'Sticky with warp-based templates, Fixed'n'Sticky and target module(s) to be fixed must be configured in a special way.

Target module(s) to be fixed:

- Set Module Class Suffix advanced parameter to 'style-<module style>', where <module style> is a style suggested by your template documentation or the one selected for your module position in file <template dir>/layouts/module.php. For example, 'style-line' or 'style-box' etc.

Fixed'n'Sticky:

- Set Module Class Suffix advanced parameter to 'style-raw'
